

Amendments to the Claims:

This listing of claims replaces all prior versions and listings of claims in the application:

Listing of Claims:

1. (Currently Amended) A method for positioning a mobile station, comprising:
~~the mobile communication network, when receiving a positioning request from a mobile station, instructing repeaters to send auxiliary positioning signals, and the mobile station measuring the position estimation parameters according to the received auxiliary positioning signals sent from the repeaters and downlink signals sent from the base station, and then estimating the position of the mobile station according to the measurement results, and thereby implementing the positioning of the mobile station~~
 - a. instructing a serving base station to measure Round Trip Time (RTT) between the serving base station and the mobile station, when a positioning request from the mobile station is received in a mobile communication network, receiving a measurement result reported from the serving base station, and at the same time sending a measurement control message to the mobile station;
 - b. determining all repeaters that take the serving base station as a donating base station, configuring auxiliary positioning parameters for the repeaters, and controlling transmission of auxiliary positioning signals from the repeaters to the mobile station;
 - c. measuring, in the mobile station, Time Differences of Arrival (TDOAs) between the base stations and the repeaters according to the measurement control message sent from the mobile communication network and the auxiliary positioning signals sent from the repeaters, and reporting TDOA measurement results to the mobile communication network; and
 - d. determining a position of the mobile station by estimating, in the mobile communication network, a position of the mobile station according to received RTT between the

serving base station and the mobile station as well as TDOAs between the base stations and the repeaters.

2. (Canceled)

3. (Currently Amended) The method for positioning a mobile station according to claim 1 2, wherein said auxiliary positioning parameter includes: an Idle Period DownLink (IPDL) parameter, ~~the~~ a scrambling code assigned to a repeater, and carrier frequency and transmission power(s) of the auxiliary positioning signals.

4. (Currently Amended) The method for positioning a mobile station according to claim 1 2, wherein said auxiliary positioning signal is a Primary Common Pilot Channel (P-CPICH) sent only during IPDL and is modulated with ~~the~~ a scrambling code synchronized with the base station ~~and is sent only during IPDL.~~

5. (Currently Amended) The method for positioning a mobile station according to claim 1 2, wherein said measurement control message ~~in step e~~ comprises: information of the serving base station and information of ~~the~~ an adjacent base station[[s]]; said information of the serving base station comprising ~~the~~ a primary scrambling code of the serving base station; said information of ~~an~~ the adjacent base station ~~comprises~~ comprising a primary scrambling code of the adjacent base station, Relative Time Difference (RTD) between the adjacent base station and the serving base station, and a width of ~~the~~ a search window.

6. (Currently Amended) The method for positioning a mobile station according to claim 5, wherein said measurement control message also comprises information of repeaters inserted in the information of the adjacent base station stations, which wherein the information of the adjacent base station further comprises: scrambling codes of the repeaters[[,]] and RTDs between the serving base station and the repeaters, ~~and widths of the search windows.~~

7. (Currently Amended) The method for positioning a mobile station according to claim 6, wherein said RTDs between the serving base station and the repeaters are determined according to the distances between the repeaters and the serving base station as well as the IPDL parameter[[s]], or obtained by measurement using a Location Measurement Unit (LMU).

8. (Original) The method for positioning a mobile station according to claim 5, wherein said scrambling code of a repeater is one of 512 primary scrambling codes and is different from those of adjacent base stations individually.

9. (Currently Amended) The method for positioning a mobile station according to claim 6, wherein said step process d further comprises:

~~d1- the mobile communication network (d1)~~ searching in the measurement results of TDOA according to the scrambling codes of the repeaters; ~~and~~
determining whether the mobile station is within the coverage area of repeaters according to the TDOA measurement results; ~~if so, executing step d2; otherwise executing step d3;~~
d2- (d2) correcting the TDOA measurement results and estimating the position of the mobile station if the mobile station is within the coverage area of the repeaters; and
d3- (d3) estimating the position of the mobile station directly with the measurement results if the mobile station is not within the coverage area of the repeaters.

10. (Currently Amended) The method for positioning a mobile station according to claim 9, wherein said step process d1 further comprises:

~~d11. the mobile communication network, according to the scrambling codes of the repeaters; (d11)~~ determining, according to the scrambling codes of the repeaters, whether the TDOA measurement results of TDOA from the mobile station contain a TDOA, ~~the scrambling code corresponding to which being that of a repeater;~~ if so, executing step process d12; otherwise executing step process d3;

d12- (d12) determining the a time delay and coordinate of the repeater according to the obtained scrambling code of the repeater, and working out the distance between the repeater and the serving base station; and

d13- (d13) determining whether the TDOA corresponding to the repeater is approximately equal to the sum of time delay of the repeater and the time value obtained through dividing the distance between the repeater and the serving base station by the speed of light; if so, executing step process d2; otherwise treating the repeater as a pseudo adjacent base station and executing step process d3.

11. (Currently Amended) The method for positioning a mobile station according to claim 9, wherein said step process d2 comprises:

d21- (d21) determining the Time of Arrival (TOA) between the serving base station and the mobile station, the time delays of the repeaters, the distances from the repeaters to the serving base station, the TDOAs between the adjacent base stations and the serving base station, and the TDOAs between the repeaters and the serving base station;

d22- (d22) subtracting the TDOAs between the repeaters and the serving base station from the TDOAs between the adjacent base stations and the serving base station to obtain the TDOA between the adjacent base stations and the repeater; subtracting the time value obtained through dividing the distances between the repeaters to the serving base station by the speed of light from the TOA between the serving base station and the mobile station, and subtracting the time delays of the repeaters from the above-obtained results, to obtain TOAs between the mobile station and the repeaters; and

d23- (d23) determining the position of the mobile station according to the TDOAs between the adjacent base stations and the repeaters as well as the TOAs between the mobile station and the repeaters, in conjunction with the coordinates of the repeaters and the coordinates of the adjacent base stations.

12. (Currently Amended) The method for positioning a mobile station according to claim 11, wherein said adjacent base stations include ~~the a~~ a repeater that is treated as a pseudo adjacent base station.

13. (Currently Amended) A repeater for implementing the function of positioning the mobile station, comprising:

a downlink processing channel and an uplink processing channel, wherein said downlink processing channel includes an added auxiliary positioning unit, ~~which receives downlink signals from the base station and signals carrying auxiliary positioning parameters sent from the mobile communication network, generates and sends auxiliary positioning signals to the mobile station~~
a communication module operable to receive signals carrying auxiliary positioning parameters sent from a mobile communication network;

a frame timing recovery module operable to receive downlink signals from a base station, process the signals to obtain a frame synchronization signal, and send said frame synchronization signal to a timing control module and a pilot modulating module, respectively;

a timing control module operable to receive the frame synchronization signal sent from the frame timing recovery module, and generate and send a pulse sequence to the pilot modulating module, wherein

the pilot modulating module, which receives the frame synchronization signal sent from the frame timing recovery module and the pulse sequence sent from the timing control module, is operable to generate and send auxiliary positioning signals to the mobile station.

14. (Canceled)

15. (Original) The repeater according to claim 13, wherein said downlink processing channel comprises a low noise amplifier, a filter, and a power amplifier.

16. (Currently Amending) The repeater according to claim 13, wherein said auxiliary positioning unit, ~~depending on the actual structure of the repeater,~~ also comprises:

a RF processing module operable to output RF signals to an intermediate frequency processing module comprising ; ~~which comprises~~ an automatic gain control sub-module, a RF receiving and filtering sub-module, and a down frequency converter, ~~and outputs RF signals to an intermediate frequency processing module;~~

an intermediate frequency processing module ~~, which comprises~~ comprising an intermediate frequency filtering sub-module, an analog-digit converting sub-module, and a digital down frequency converter wherein the intermediate frequency processing module is operable to receive RF signals sent from the RF processing module, process RF signals, generate base-band signals, and send the base-band signals to the frame timing recovery module, and receives RF signals sent from the RF processing module, processes the RF signals and generates base-band signals, and sends the base-band signals to the frame timing recovery module.

17. (Currently Amended) The repeater according to claim 13, wherein said communication module is operable to receive[[s]] auxiliary positioning parameters from the base station through signaling.

18. (Currently Amended) The repeater according to claim 13, wherein said communication module is operable to receive[[s]] auxiliary positioning parameters via the operation and maintenance terminal of the repeater.

19. (Original) The repeater according to claim 13, wherein input signals of said auxiliary positioning unit are directly obtained through coupling with the forwarding antenna.

20. (Original) The repeater according to claim 13, wherein input signals of said auxiliary positioning unit are obtained from a node in the downlink processing channel of the repeater.

21. (Currently Amended) The repeater according to claim 13, wherein ~~output signals of~~ said auxiliary positioning unit is operable to send output signals ~~are outputted~~ after combining with signals from the repeater at a node in the downlink processing channel of the repeater.

22. (Currently Amended) The repeater according to claim 13, wherein ~~output signals of~~ said auxiliary positioning unit is operable to send output signals ~~are sent~~ via a forwarding antenna after combining with signals from the repeater before the power of the downlink processing channel of the repeater is amplified.
